Bridge Mobile Live Link

Overview

The Live Link module allows the user to pick items 'live' from the hand-held devices without the need to access the back end system. The Opera tables and sales orders are automatically updated from the hand-held devices. There is also an option to keep stock levels updated live.

Live order information

Order information is retrieved on a 'live' basis by looking at the information in the tables. All of the sales orders are displayed on the hand-held device and are available for immediate picking.

Live picking

Users are able to pick items from the orders on the hand-held devices. It is also possible to access live stock look-up, which allows the user to see the stock levels prior to picking the items.

Automatic updating

Once items have been picked, the sales order is updated automatically. There is also an option to update stock levels on a live basis, however this can be done at the point of invoicing if required.

Benefits

There are many benefits to having the Live Link module:

- No PC use is required
- Live picking is enabled
- Stock look-up is live
- Sales orders are updated automatically
