COURIER

You have just picked an order, it's packed, and ready to be sent; your next step is to organise the courier….
Courier will transfer the completed Sales Order from the hand-held device to the server and upload the delivery details to your courier. This is done through a step by step selection process of delivery method and details relevant for the courier. Bridge Courier will decrease lead time and increase customer satisfaction.

Orders

The Courier module provides a solution for all your despatch requirements and links perfectly with Sales Order Processing for a united Supply Chain process. In order to engage the Courier module a Sales Order must first be downloaded to a hand-held device, then picked, packed and finally the data has to be sent back to the server. After this point the Courier module takes over the next stage of the process from a PC.

Methods of Despatch

Most major courier and postal services can be incorporated into this module. We currently interface to APC, Courier Logistics, DHL, DPD, DX, Pallex, Parcel Force, Royal Mail, TNT, Tuffnells, UPN and UPS. After completing the selection process for the method of despatch, all the relevant details can be sent to the courier from the PC. From this moment the job is turned over to the courier for confirmation of collection.

Send Data

Once the completed Sales Order has been reviewed and committed to the ERP system from a PC, the Courier module offers multiple options for the appropriate despatch of the Sales Order. Create a new despatch method, enter details about the company, driver and pricing, or select a pre-existing default that has already been set for your requirements.

Options

Courier is completely customisable to your company and your specific needs in order to ensure that the module provides the most efficient benefit to your Sales Order Processing system. Courier links can be added or edited as your company grows and develops.
