

BRIDGEWMS

EDI LINK

You have just received an order from your online shop; your next step is to create a Sales Order... Bridge EDI Link automates this process, creating a personalised Sales Order document ready to be authorised for download to any hand-held device. Within minutes your new order has progressed from your Website into a package ready for delivery. Bridge EDI will decrease lead time and increase productivity.

Import File

Create a Sales Order compatible with Opera without the need for multiple processes. This module will take the online shop file which has been produced for an order and transfer it into the appropriate Bridge folder, translating it into the language of Opera. This gives you the ability to import all relevant files directly into Opera from your online shop, linking to the Supply Chain system for a user friendly solution. All data will be exported automatically reducing potential errors, decreasing lead time and increasing order quantity fulfilment capability.

File Download

To complete the process in the most synchronised way possible, this module will translate the files that have been imported into Opera from your online shop. These newly created documents will then be compatible for download onto any hand-held device. Once the orders have been downloaded they are ready for picking in the warehouse like every other Sales Order you have produced.

SKU Matching

Differing online shop and warehouse part numbers will no longer be an issue with the EDI Link module. Multiple part numbers can be linked under the title of one item rectifying any recognition problems Opera and your online shop would have at the point of downloading Sales Orders. This module will continue to simplify processes for you as all information regarding part numbers will be saved by Opera and this information will be cross referenced for all future items, erasing the need to repeat information lookup tasks.
