MULTILOCATION

You need to locate an item that is out of stock in your main Warehouse; your next step is to check your other warehouse locations for a movement to complete a Sales Order.... MultiLocation manages the location of an item of stock across multiple bins and locations. Using an automated FIFO approach ensures stock will never sit in a location long enough to go out of date. This, alongside multiple Quarantine Locations, will allow complete stock management between bin locations.

Stock Details

Designating newly created stock items to MultiLocation management is automated, removing the need for manual allocations. If required, it's also possible to break the FIFO rules for issue and pick stock from the Quarantine Bin. Existing stock can also be set up to MultiLocation locating items by a specific bin along with the quantity and dates for FIFO stock. For complete stock overview, bin transactions and content details can be checked for every bin.
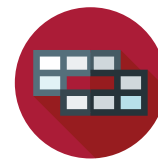

Stock Management

Bins can be created for your stock including details, such as description and dimension, and Default Pick Bins can be set with min and max levels which will indicate when a bin needs to be replenished. For accurate stock management across multiple bin locations there are many additional options from the hand-held device. It is possible to transfer, write off and adjust stock items. You can also view a stock item by bin or by overall level.

Stock Warehouse

MultiLocation can designate particular warehouses to participate in MultiLocation management and if no Quarantine Bin location exists the user will be prompted to enter one. Required warehouses are set up in Opera and there is an option to allocate the warehouse stock to MultiLocation. A stock/warehouse combination is also available and this will allow the picking of the default Bin Location into which stock inward transactions can be placed. This can be either a Live Bin or a Quarantine Bin.

Activation

A comprehensive setup programme is provided to globally create the necessary tables and links from the existing stock. This removes the need to manually search through numerous stock items and flag the required items that need to be reallocated to MultiLocation Management.
