BRIDGE WMS

The Complete Warehouse Solution

Proof of Delivery

The Bridge WMS Proof of Delivery Module keeps track of your orders when they are out for despatch. Orders can be confirmed delivered on a hand-held device via the recipient's signature and/or photographic evidence. Proof of Delivery will increase traceability of products and reduce the risk of lost packages.

Loading

The loading tab manages the loading of all orders ready for despatch, helping to organise all packages into the correct vans for delivery. When loading packages into a van, package codes or delivery numbers are scanned and assigned to that van. The assigned orders can then be delivered off on the hand-held device.

Key Features

- Multiple vans.
- Can easily load multiple packages for the same address.
- If a package is already assigned to a van, when scanned, it will prompt for the correct preassigned van.

Delivery

The delivery option provides the user with a list of deliveries for their assigned van, with information such as postcode, delivery number, and number of packages. This helps the driver to identify and check which packages go to which address under which delivery number and helps to ensure all packages are accounted for.

Key Features

- Scan packages to prevent missed items.
- Deliver all option available for more efficient delivery.
- Delivery confirmation required via signature and or photograph using the scanner.

Unsuccessful Delivery

The 'unable to deliver' option allows users to record which deliveries failed and for what reason. For example, the delivery location was inaccessible, or the address was incorrect or incomplete. It will then be recorded on the system so that the time and date of the attempted delivery, and the reason for failure is readily available if needed.

Key Features

- Customisable reasons for the failed delivery.
- Reasons can be set in Despatch Manager.
- Maintains control over all failed deliveries.

Directions

The directions option opens google maps for easy, streamlined access to directions from the user's current location to the necessary delivery address. This increases efficiency as the app is made more readily available without having to exit Bridge WMS.

Key Features

- Direct link to google maps.
- Increased efficiency.
- Familiar and easy to use.
