WORKS ORDER MANAGER

You want to identify one order and follow its progress; what is your next step?... Works Order Manager keeps track of all stages of production. Orders are added to the board and monitored by order number, product code and operation stage throughout manufacturing/sales process. A hand-held device scans the item/order and updates the board at each stage of its process.

Orders

Orders are added and monitored throughout production. Immediate updating at all stages allows real-time monitoring of production. Scanning by a hand-held device at each stage is an efficient way of keeping track of progress.

Production Transfer

Once the order has been marked and transferred to the production board it is then ready to be downloaded onto a hand-held device for picking. This process continues as normal with the additional ability to now monitor the marked order throughout each stage of order fulfilment. There is no limit to the amount of orders that can be marked at any one time, so monitoring is completely at your discretion.

Pick Order

Tracking an incoming order and following its progress as it moves through the warehouse is made simple with Works Order Manager. From the moment an order is received into order processing it can be marked for observation before the order is allocated on to be picked.

Completed Transfer

Once the order has been completed and is awaiting despatch to the customer it is possible to unmark the order from the Works Order Manager when it is no longer necessary to observe its movements. Similarly you can unmark an order if you are otherwise satisfied with the progress of the order.
